Conclusions

E-Commerce Process

Conclusions

Conceptual maps are easy tools for representing complex processes, but they are limited because they cannot show their flow without an adjunct explication.

The *coverage tree* shows the *pst* but can't differentiate sequential and parallel events.

The *math expressions* are more precise to describe the *pst* but lost the visual representation and it's difficult to identify the *loops*.

The *pseudocode*, as *math expressions*, is precise with the process flow but lost the visual representation.

Finally, the *flowchart* is a recurse that helps to describe the *pst* with minimal elements that omit some important events.

Future work

In the near future, this work will be extended to represent the coverage graph in **Petri nets** with the aim of optimizing the *pst*
