Methodology

Objective

Determine the relationship between openness to change in academic development in a public HEI.

Hypothesis

Openness to change influences academic development

Design of the investigation

Quantitative

not experimental

cross

Conceptualization of independent variable, openness to change

Conceptual definition

Openness to change is generated by the strategic orientation factors of companies. The need for change generally begins with the redefinition of the strategic direction, thereby affecting the organizational structure, processes and procedures, which in essence transcends to affect the basic values, beliefs, habits and the system of meanings, this is, the culture of the company (González and Hernández, 2007).

The challenges of higher education must be associated with the government policies of the countries that are also subject to the determinations of the State reform. This supposes in the teacher an attitude of openness to change. (Palencia, 2006).

The concept of openness to change by Finkelstein and Hambrick (1996) has been treated by the strategic literature, linked to cognitive elements such as expectations, performance patterns, professional and social projects.

Strategic change is more likely to be successful when there is (empowerment) motivation of people, that is, they are given the possibility of giving their opinion on the change process, the assumptions that make it necessary and the possible results (Lines, 2004).

Chosen element

Habits

Educational policies

Professional Projects

Motivation

Table Conceptualization of independent variable, Openness to Change. Own source.

Dependent variable, Academic development.

Academic development is the validity and professional updating in the various areas of the work of academics, seeing updating as the renewal of knowledge or new topics inherent to the training profile of each teacher (Donoso, 2018).

Professional update

The desirable academic profile in the teacher represents the level of academic development, that is, an “integral academic” that develops, at the same time, teaching activities, student tutoring, research and bonding. Where linking is an activity to support teaching that allows collaboration between the higher education institution and the government, business and / or social sectors, benefiting both actors through the direction and collaboration of integrative projects (Urbano, Aguilar and Rubio , 2006).

Bonding

Academic development occurs from teacher training and development as a result of strategies aligned between national development policies, science and technology strategies, and teacher training and development policies, on a continuous and permanent basis. Teacher training is a continuous process of didactic-pedagogical learning (Donoso, 2018).

Training

Academic development in teachers requires a change, a significant adjustment in roles to follow the international trend, research-oriented teachers individually or collegially publishing and disseminating facts or knowledge (Goodlad and Holmes, 1995).

Investigation

Tutoring is considered by Vázquez, García, and Oliver (2008), as an integral activity in academic development, a process of accompaniment during the training of students, which is specified through personalized attention to a student or a small group of them by competent and trained academics for this function, counseling can also be mentioned as a follow-up to the student or orientation related to the professional profile of the student.

Tutorships

Shows

The teachers who work at the Higher Technological Institute are 70 of which are subdivided into 7 academies. Therefore, a sample of 55 teachers from the Higher Technological Institute must be made, with a confidence level of 95% and a tolerance of 5%.

Statistical treatment

I dealt with the Pearson correlation test to contrast the hypothesesThe chi-square independence test was used to identify the relationship between the variables indicators (items)

Results

Instrument reliability test (questionnaire)

Estadísticos de fiabilidad

| Alfa de Cronbach | N de elementos |
|------------------|----------------|
| .955 | 57 |

To determine the degree of reliability of the instrument used, the alpha Cronbach test was used through the item variance method (Cordova, 2009). A pilot test was applied to 15 people with 57 items.

| TABLA DE CATEGORIAS | ESCALA | CATEGORIA |
|---------------------|-------------------------|----------------------------|
| | $r = 1$ | Confiabilidad perfecta |
| | $0.90 \leq r \leq 0.99$ | Confiabilidad muy alta |
| | $0.70 \leq r \leq 0.89$ | Confiabilidad alta |
| | $0.60 \leq r \leq 0.69$ | Confiabilidad aceptable |
| | $0.40 \leq r \leq 0.59$ | Confiabilidad moderada |
| | $0.30 \leq r \leq 0.39$ | Confiabilidad baja |
| | $0.10 \leq r \leq 0.29$ | Confiabilidad muy baja |
| | $0.01 \leq r \leq 0.09$ | Confiabilidad despreciable |
| $r = 0$ | | Confiabilidad nula |

Fuente: Andrew, Pedersen, & McEvoy, 2019

Results

Parametric test

H₀: The variable academic development (DV) in the population has a normal distribution

H₁: The variable academic development (DV) in the population is different from distribution

| | Pruebas de normalidad | | | Shapiro-Wilk | | |
|----------------------|---------------------------------|----|-------|--------------|----|------|
| | Kolmogorov-Smirnov ^a | | Sig. | Estadístico | gl | Sig. |
| Desarrollo académico | .091 | 55 | .200* | .983 | 55 | .613 |
| Apertura cambio | .077 | 55 | .200* | .977 | 55 | .365 |

*. Este es un límite inferior de la significación verdadera.
a. Corrección de la significación de Lilliefors

Resultados de traducción

As the significance level is greater than 0.05, the null hypothesis is accepted; therefore, the variable academic development (DV) in the population has a normal distribution. Therefore, for the correlation analysis, the Pearson test will be applied

Hypothesis verification

General hypothesis

$$H_1 = \beta_{\text{opening_to_change}} \neq 0$$

The correlation between the population is different from zero, that is, openness to change influences academic development.

**. La correlación es significativa al nivel 0,01 (bilateral).

| Hipótesis | Interpretación de resultados |
|---|---|
| $H_1 = \beta_{\text{Motivación}} \neq 0$ La motivación influye en el desarrollo académico | <p>$r = 0.719$ Valor de significancia = 0.000</p> <p>La motivación tiene una relación positiva fuerte con el desarrollo académico.</p> <p>Como el valor de significancia es de $0.000 < 0.05$ rechazamos la hipótesis nula y la hipótesis alternativa no es rechazada.</p> |
| $H_2 = \beta_{\text{Hábitos}} \neq 0$ Los hábitos influyen en el desarrollo académico | <p>$r = 0.522$ Nivel de significancia = 0.01</p> <p>Existe una relación positiva media entre los hábitos y el desarrollo académico.</p> <p>Como el valor de significancia es de $0.000 < 0.05$ rechazamos la hipótesis nula y la hipótesis alternativa no es rechazada.</p> |

$H_1 = \beta_{\text{Proyecto_profesionales}} \neq 0$
El proyecto profesional influye en el desarrollo académico

r= 0.490

Nivel de significancia= 0.01

Existe una relación positiva media entre el proyecto de vida y el desarrollo académico,

Como el valor de significancia es de 0.000 < 0,05 rechazamos la hipótesis nula y la hipótesis alternativa no es rechazada.

$H_1 = \beta_{\text{Proyecto_vida}} \neq 0$
Las políticas educativas influyen en el desarrollo académico

r= 0.613

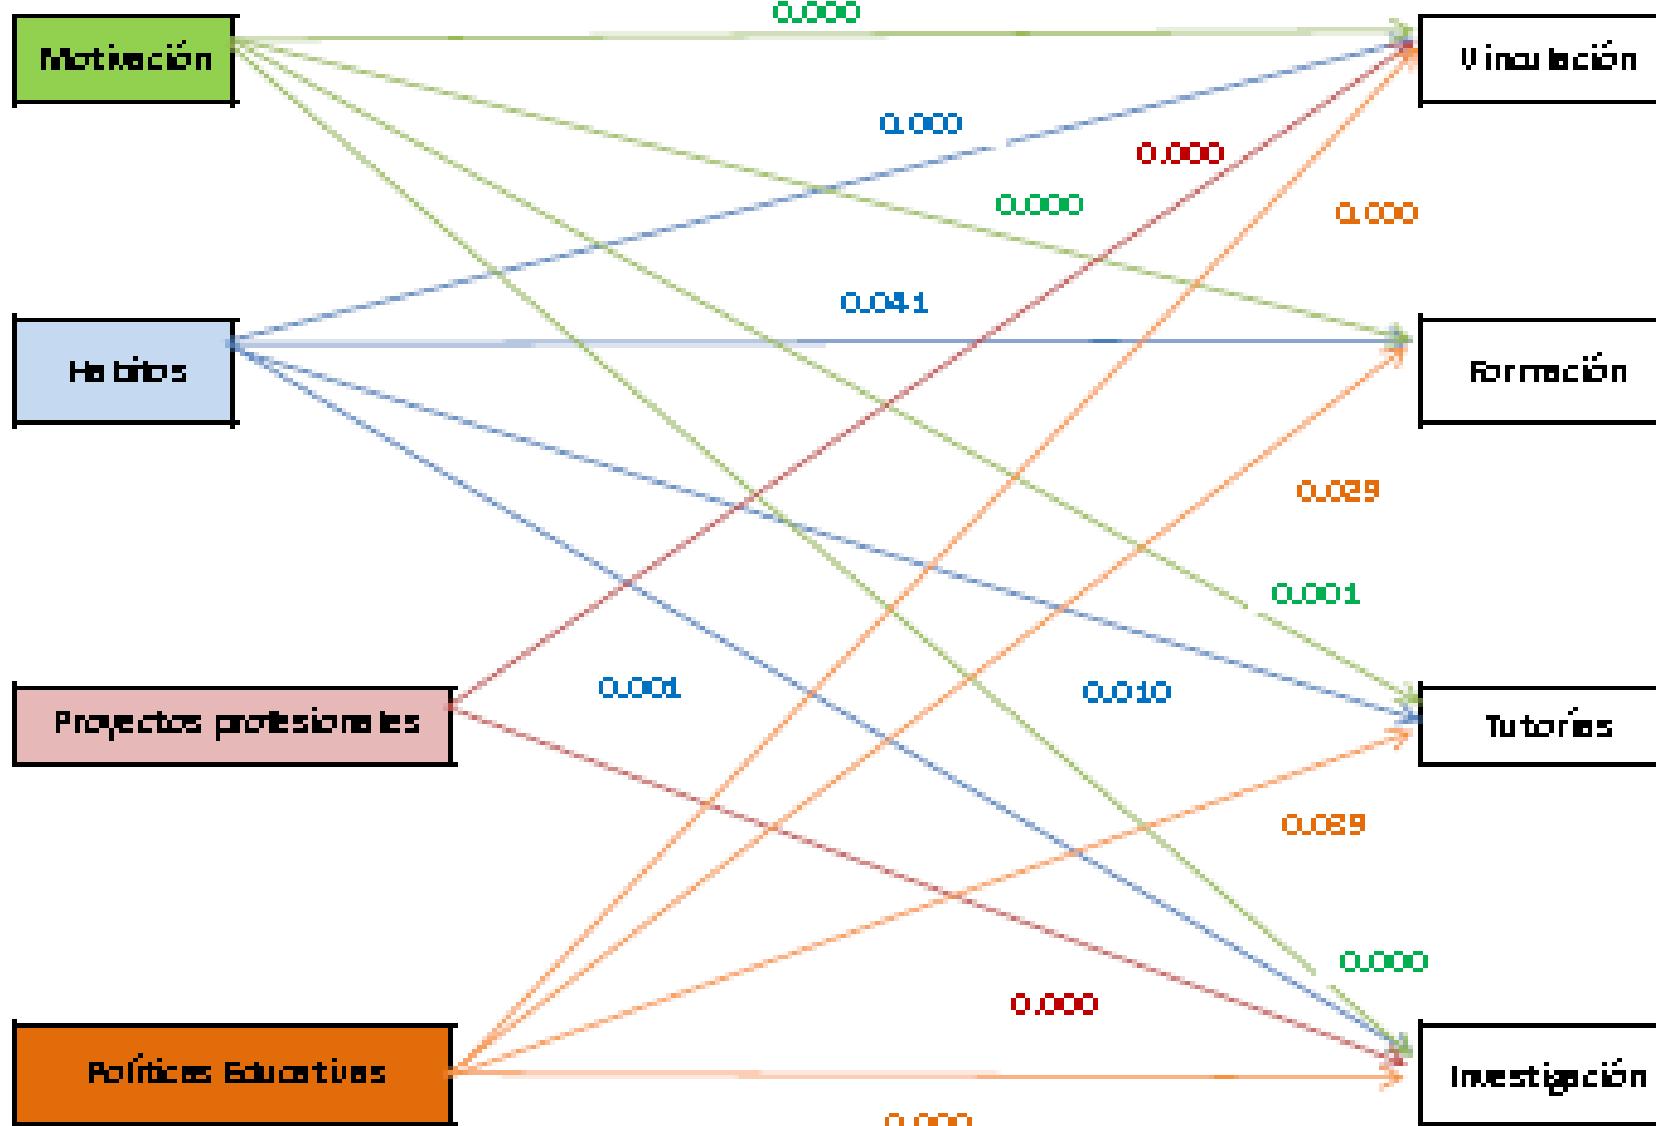

Nivel de significancia= 0.01
N= 55

Existe una relación positiva media entre los hábitos y el desarrollo académico.

Como el valor de significancia es de 0.000 < 0,05 rechazamos la hipótesis nula y la hipótesis alternativa no es rechazada.

A pertenencia

Desarrollo académico

CORRELACION DE PEARSON
significancia Bilateral

RESUMEN DEL MODELO

| Tabla A Resumen del modelo | | | | |
|---|--------------------|------------|----------------------|-----------------------------|
| Modelo | R | R cuadrado | R cuadrado corregida | Error típ. de la estimación |
| 1 | 0.742 ^a | 0.551 | 0.515 | 8.69410 |
| a. Variables predictoras: (Constante), Motivacion, Habitos Proy_Profesional, Polit_educat, | | | | |

Los predictores representan el 55% de la varianza en el significado en las puntuaciones del desarrollo académico.

Las variables independientes (motivación, hábitos, Proyectos profesionales y las políticas educativas) explican, el 55.1% de la variación del desarrollo académico. En otras palabras, 44.9% de la variación se debe a otras fuentes

TABLA DE ANOVA

De la tabla de anova el p-valor es menor que 0.05, la regresión general modelo (con todos los predictores incluidos) es significativo

| ANOVA ^a | | | | | | |
|--------------------|-----------|-------------------|----|------------------|--------|-------------------|
| | Modelo | Suma de cuadrados | gl | Media cuadrática | F | Sig. |
| | Regresión | 4638.163 | 4 | 1159.541 | 15.340 | .000 ^b |
| 1 | Residual | 3779.365 | 50 | 75.587 | | |
| | Total | 8417.527 | 54 | | | |

a. Variable dependiente: Desarrollo_academico

b. Variables predictoras: (Constante), Polit_educat, Habitos, Motivacion, Proy_Profesional

Conclusions

It was identified that with a probability of error of 0.00 there is an influence between openness to change and academic development, likewise it was determined that openness to change has a medium positive correlation in the academic development of public HEI.

It was determined that motivation has a strong positive relationship with academic development, on the basis that the significance value is 0.00 less than 0.05, with a relationship of the influence that motivation has on openness to change.
