1.- INTRODUCCIÓN

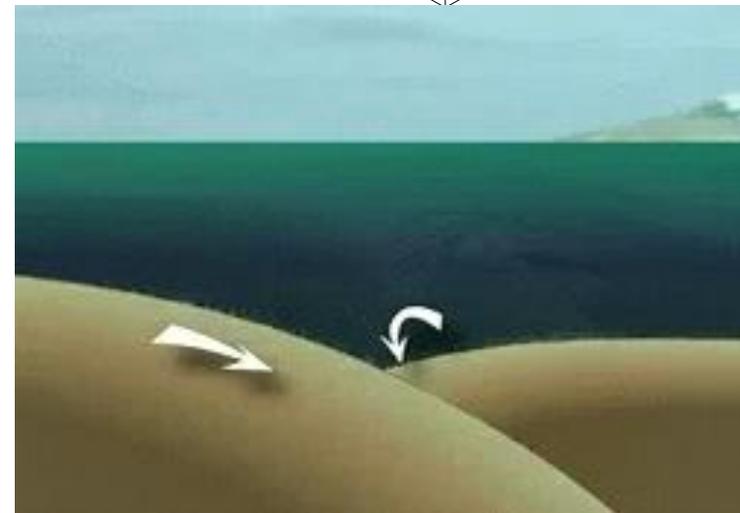

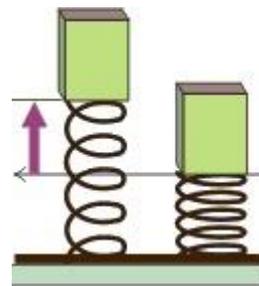

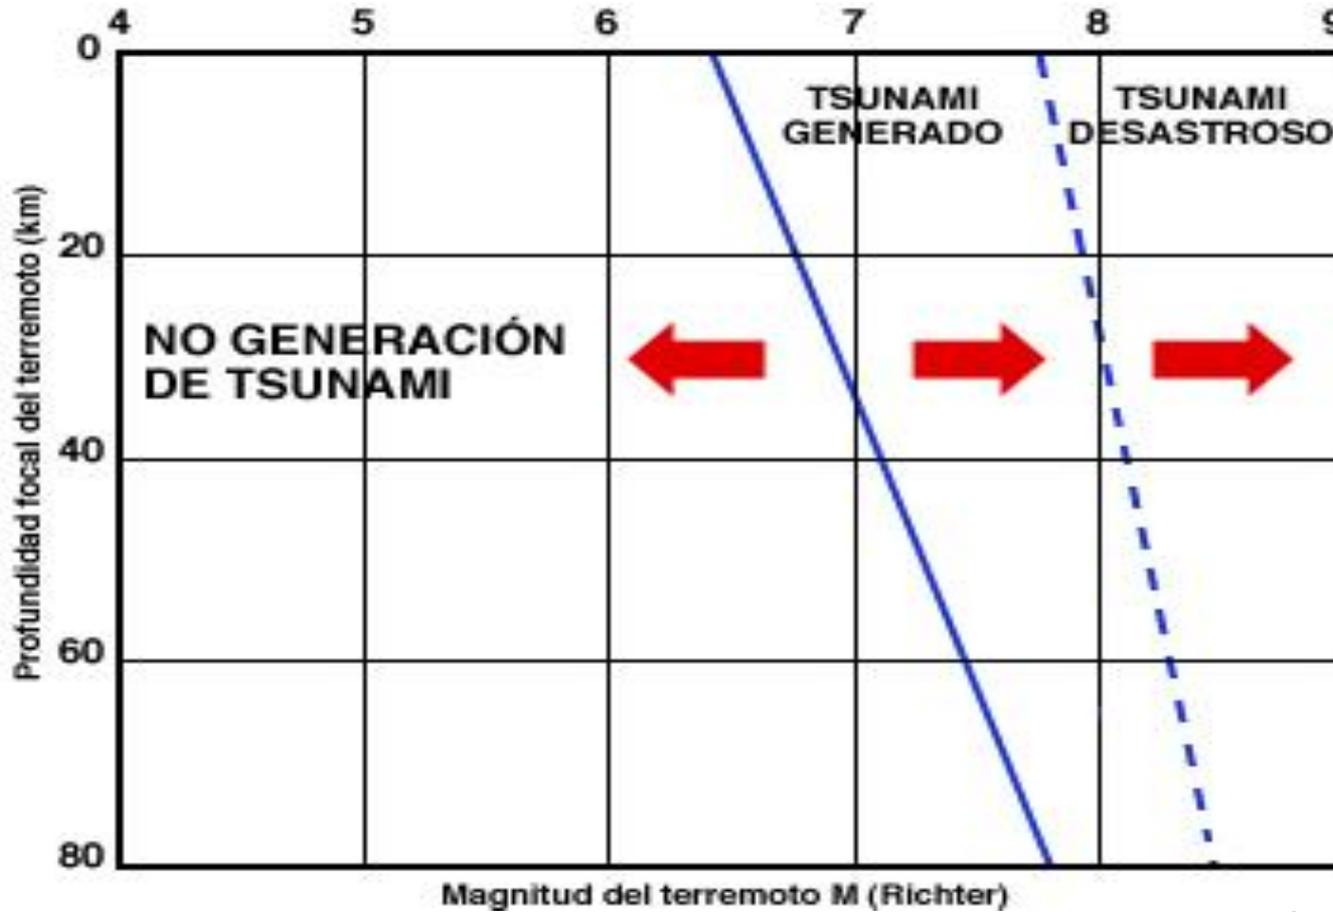

http://fp.educarex.es/fp/pruebas_acceso/2011/modulo_III/ciencias_de_la_naturaleza/3nat02.pdf

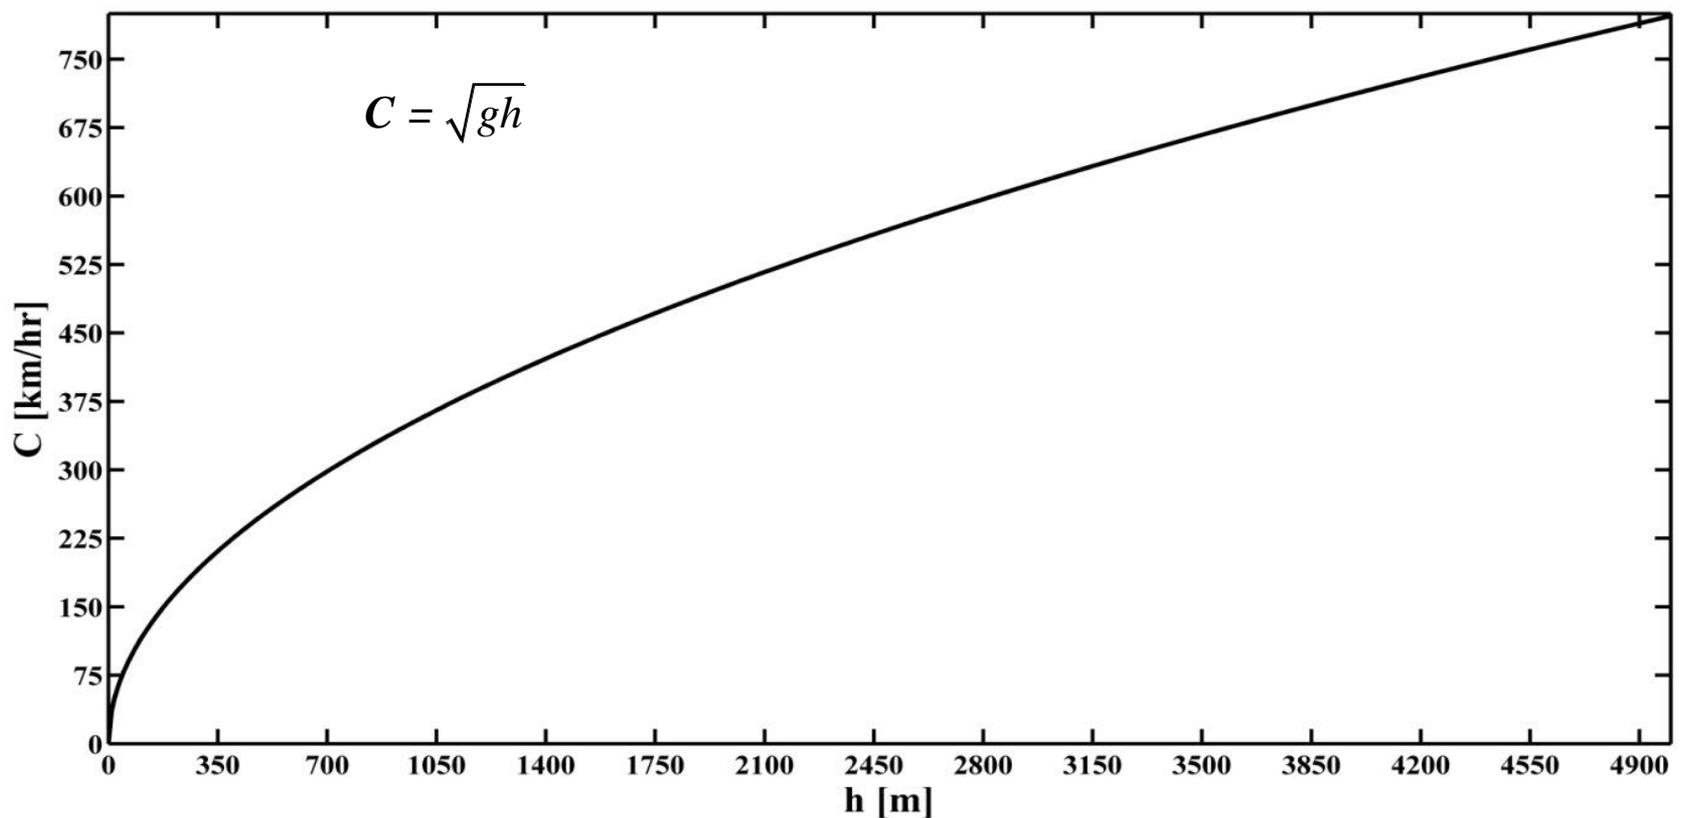

Generación del tsunami, (a) movimiento incipiente, (b) almacenamiento de energía y (c) deslizamiento repentino debido a la falla por fricción, modificado de Farreras et al., (2005).

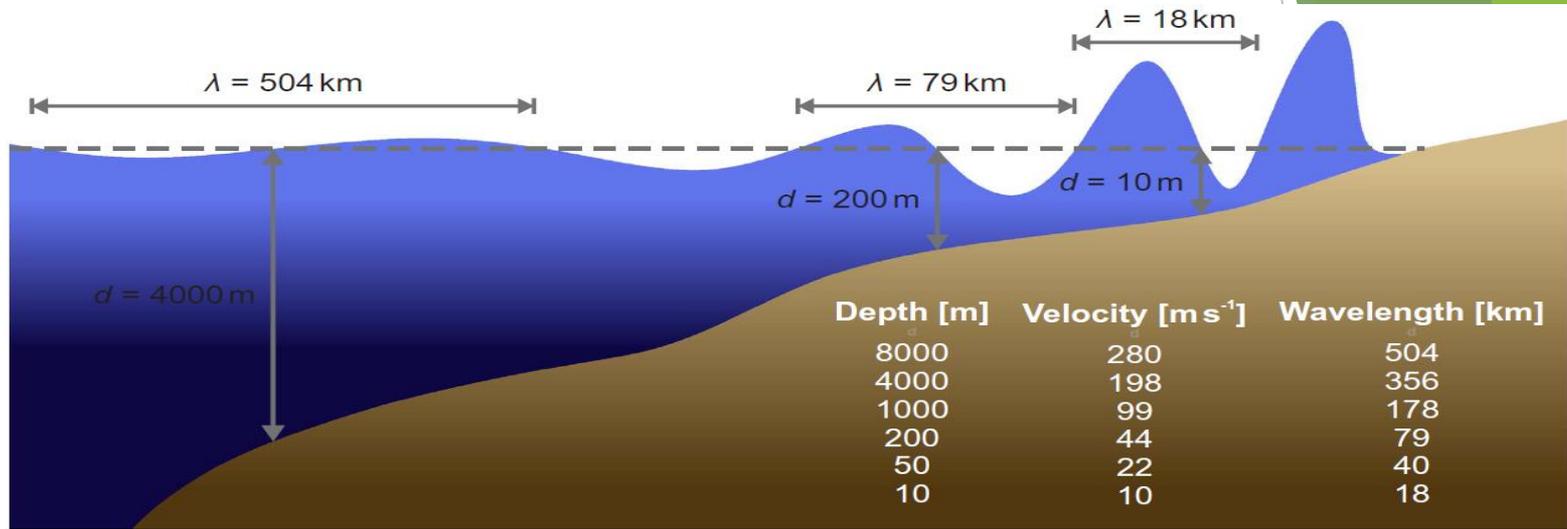

(<http://fluidos.eia.edu.co/hidraulica/tsunamis/Mecanismos.htm>)

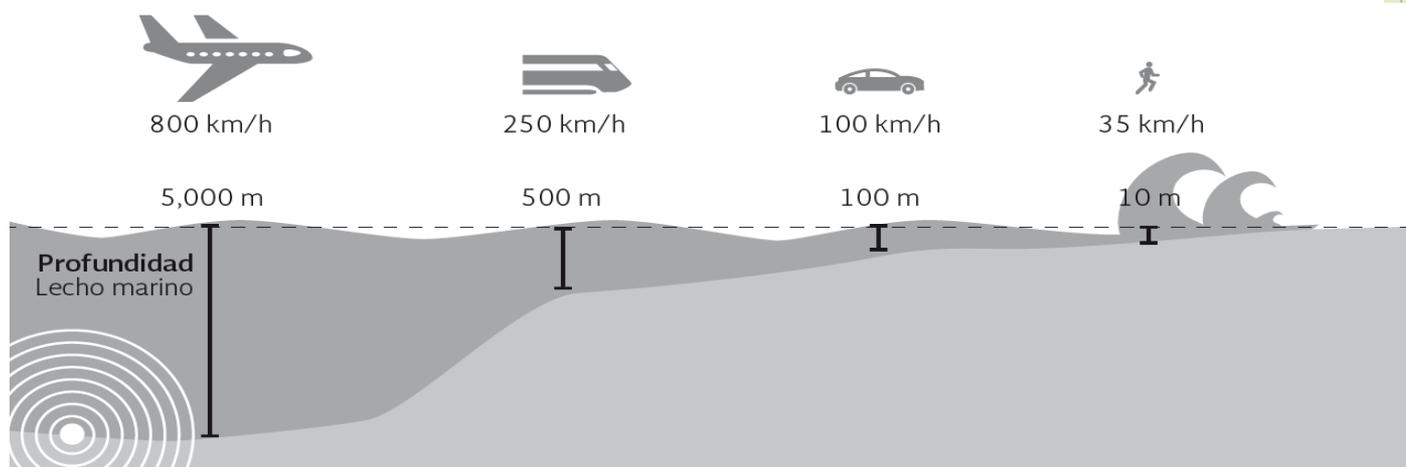

Un TSUNAMI es una serie de ondas largas gravitacionales generadas por el movimiento del fondo marino.

(Röbke and Vött, 2017)

Figure 3. Caption from Excelsior newspaper on the destruction of Cuyutlán by the June 22, 1932, tsunami.

3.- SIMULACIÓN NUMÉRICA

Un tsunami puede modelarse a través de una onda solitaria (Liu et al., 1991; Synolakis and Bernard, 2006), el cual se caracteriza por no ser una onda oscilatoria.

Hidrodinámico = COBRAS (Cornell Breaking Wave and Structure) desarrollado por Lin & Liu (1998a, 1998b).

Resistencia del Concreto (Palemón-Arcos et al., 2018).

5.- CONCLUSIÓN

Con la simulación numérica del tsunami, podemos obtener presiones en toda la pared de la estructura, las cuales sirve para generar el comportamiento dinámico ante las presiones hidrodinámicas, éstas por lo tanto determinará su diseño estructural.

El comportamiento de la ola dependerá de la batimetría.

AGRADECIMIENTOS

Universidad Nacional Autónoma de México (UNAM).

PRODEP-UNACAR.

Profesor Shih-Chun Hsiao de la National Cheng Kung University por proporcionar las mediciones de laboratorio.

Apoyo de los Fondos de Investigación del II-UNAM (“Desarrollo e implementación de un canal numérico para el estudio de la interacción oleaje-estructura en aguas profundas”).
